### Unique Sump Cleaner/Filter Vacuums and Dispenses Simultaneously

The Freddy Ecovac 200 is a versatile sump cleaner that can provide both suction and discharge of fluids at the same time. This dual action allows for solids and chips to be vacuumed from a sump while dispensing clean fluid back to the tool to wash down the table and ways. This cleaning process can be completed without taking the tool out of service.

This Ecovac has several unique features that differentiate it from other sump cleaning devices including the unit operates on 110 volt power that and can be easily plugged in throughout a plant. The unit will also suck a sump dry and can remove a puddle of liquid from a floor. This allows the unit to also function for emergency spill control.

The unit includes a convenient 50 gallon storage tank that is easily positioned within a shop because of its ergonomic design, small size, and heavy duty locking caster wheels.

The Ecovac ships complete with a 10 and 200 micron filter bag, 3 crevice attachments, a large chip extraction tool, a floor vacuum squeegee and 10 foot suction hose.

Sanborn Technologies offers the Ecovac for industrial fluid purification. The company specializes in providing recycling and waste minimization systems for metalworking manufacturers.
